RESEARCH INTERESTS: EVOLUTIONARY THEORY, PHENOTYPIC EVOLUTION, MORPHOMETRICS

I am a theoretical evolutionary biologist interested in the evolution of multivariate phenotypes, and the inherent complexities of deciphering evolutionary process in multi-dimensional phenotype spaces. I develop new analytical tools for quantifying multivariate phenotypes (morphometrics) and for characterizing patterns of phenotypic evolution. Current research emphasizes the development of phylogenetic comparative methods for multivariate datasets, and morphometric methods for characterizing patterns of shape variation and covariation. I am the primary author and maintainer of the popular software R-package *geomorph*, which may be used for shape analysis and for phylogenetic comparative analyses of high-dimensional data. My empirical work focuses on morphological evolution in vertebrates, with an emphasis on plethodontid salamanders.
