According to the Recording Industry Association of America, sales of recordings in the United States were about $7 billion in 1990. Here is data on the sales (in billions of dollars) of the most popular genders of music sold that year:

- Rock 2.8
- Jazz 0.4
- Rap 1.4
- Classical 0.3
- Pop 1.0
- Country 0.7

1. **(2 pts.)** Present these data on a correctly labeled Pareto chart. See Figure 1 (a).

2. **(1 pt.)** Present these data using a pie chart. Don’t forget to label it!!

The information provided on the sales for the most popular kinds of music adds up to only 6.6 billions, which is less than the total given in the statement of the problem (about 7 billions). We can draw the pie chart only if we have the information about all the categories. In this case, we could say that all other categories can be summed up in one additional category, say ”Other”. If we do so, the pie chart would look like the graph in Figure 1 (b).

Figure 1: Graphical displays of the data
