Summary Measures

• Central Tendency
  – Sample midrange
  – Sample median
  – Sample mean

Measures of Center

• Sample Midrange
  – Average of the minimum and the maximum.
  – Body mass of Canidae:
    \[
    \frac{1 + 36}{2} = 18.5 \text{ kilograms}
    \]
  – Greatly affected by outliers.

• Sample Median
  – A value that divides the data into a lower half and an upper half.
  – About half the data values are greater than the median about half are less than the median.
Sample Median (n even)
Body Mass (kg) of *Canidae*

Median = 8 kilograms
Measures of Center

- Formula for the sample mean

\[ \bar{y} = \frac{Total}{n} = \frac{\sum y_i}{n} \]

Sample Mean

- Body mass of *Canidae*
- Total = 260
- n = 28

\[ \bar{y} = \frac{Total}{n} = \frac{260}{28} = 9.3 \text{ kg} \]

What does each measure?

- The sample midrange is midway between the smallest and largest values.
- The sample median divides the distribution into a lower and an upper half.
- The sample mean is the balance point of the distribution.
Which summary is “best”?

• For symmetric shapes the sample mean is most informative.
• For skewed shapes the sample median is better because it is less affected by outliers.

Summary Measures

• Dispersion or spread
  – Sample range
  – Sample mean absolute deviation
  – Sample standard deviation

9-hole Golf Scores

46, 44, 50, 43, 47, 52
Sample Range = maximum – minimum
= 52 – 43 = 9 strokes
Measures of Spread

• Based on the deviation from the sample mean.
• Deviation from the mean:
  
\[ (y - \bar{y}) \]

9-hole Golf Scores

45, 44, 50, 43, 48, 52

\[ \bar{y} = \frac{282}{6} = 47 \text{ strokes} \]

Deviations from the Mean

\[ \begin{align*}
  y & \quad \text{Score} \\
  40 & \quad -4 \\
  45 & \quad -3 \\
  50 & \quad -2 \\
  55 & \quad +1 \\
  47 & \quad +5
\end{align*} \]
Sample Mean Absolute Deviation

\[ MAD = \frac{\sum |y - \bar{y}|}{n} \]

Absolute Deviations

\[ MAD = \frac{4 + 3 + 2 + 5 + 3 + 1}{6} = \frac{18}{6} = 3.0 \text{ strokes} \]
